Press Release

Avvio Networks Introduces Element Management System (EMS) software

EMS displays SNMP data in a visually appealing, simplified and intuitive format.

Bedford, MA - July 24, 2008 - Avvio Networks demonstrated their Element Management System (EMS) software at NXTComm in Las Vegas last month. The GUI-based EMS software allows network managers to remotely monitor and reconfigure network elements from their NOC. EMS interoperates with HP Openview and works on a number of popular platforms like Windows, Linux and Solaris.

The EMS software enables monitoring of MIB objects, events and alarms. It allows you to drill down from a network view to chassis, module, and component views. Alarms are color coded as critical, major and minor for immediate detection. Alarm and event histories are available at the network, chassis and module levels. This data can be an invaluable historical record of network operation.

The EMS software can also be used to reconfigure network elements. The AM4025E Edge ROADM provides an example of remote reconfiguration. The AM4025E allows you to add and drop up to 8 contiguous channels at any given time. If an AM4025 is currently configured to drop ITU channels 17, 18 and 19, and another channel is required at that site, you can remotely add ITU channel 20 from the NOC using EMS, all without disrupting network operation.

The password protected EMS software allows for strict user management. Two types of user can be added or deleted, Superusers and standard users. Superusers can configure network elements while standard users have read-only capability.

The Avvio Networks Element Management System software is the perfect complement to your existing Network Operating System management software.

About Avvio Networks

Avvio Networks is a manufacturer of fiber optic networking equipment. Our standards-based solutions interoperate with existing systems, enabling our customers to preserve their network investment while cost-effectively upgrading to a more flexible network infrastructure. Whether your current network is SONET/SDH, Ethernet or just dark fiber, Avvio Networks has the products you need to offer high speed optical transport for voice, data, video, high speed Ethernet access, storage or wavelength services.
